### How to add FactoryTalk import to Nimbus Alarm Server

Nimbus Alarm Server will use a separate application (service) to access alarms from FactoryTalk.

The application is named *FactoryTalk2Nimbus*. It will cyclically scan the *FactoryTalk SQL Alarm History* database. If the application finds any new alarms it will pass it on to *Nimbus Alarm Server*.

Since it is SQL and (depending of SQL setup) remote accessible, the application may be located either in the FactoryTalk server or in the Nimbus server, or even in some other server. Mostly all three softwares are located in the same machine.

*FactoryTalk2Nimbus* passes alarms to *Nimbus Alarm Server* either by placing the alarms directly in the Nimbus internal alarm queue or using TCP. The first method is the default method and requires that *FactoryTalk2Nimbus* is installed in the same server as *Nimbus Alarm Server*.

## Setup FactoryTalk to store alarms in the historical database

See the FactoryTalk Administration Console Help (Contents), where you will find how to setup SQL storage of alarms in section FactoryTalk Help -> FactoryTalk Alarms and Events -> Set up alarm history logging.

When setting up the SQL connection you could use the name and password of your choice for the database, you must however later on edit the *FactoryTalk2Nimbus.ini* configuration file to reflect these settings.

If you wish to place *FactoryTalk2Nimbus* on another server you will have to ensure firewall and TCP settings in *SQL Server Configuration Manager* enables remote access to the SQL Server. You further on has to ensure the login method (which should be reflected in the connection string in *FactoryTalk2Nimbus.ini*) allows remote access from the server where *FactoryTalk2Nimbus* resides.

Here is an example of the SQL connection setup in FactoryTalk

*FactoryTalk2Nimbus* will never delete any rows from the SQL database since it is also used for presenting alarm history in the *FactoryTalk View Client*. You could set the deletion period as you like.

Ensure you select event log flush time to 1 minute and granularity to 1 event as above right to ensure Nimbus Alarm Server will detect new alarms as fast as possible.

Now the FactoryTalk setup is fininshed. Let's continue with the Nimbus applications.

# Install FactoryTalk2Nimbus

First of all install *Nimbus Alarm Server* on the server where is should reside before installing/configuring *FactoryTalk2Nimbus*.

As the FactoryTalk2Nimbus application consists of only two files there is no installation program for it.

Create a new folder on the server where FactoryTalk2Nimbus should reside:

C:\Program Files (x86)\TroSoft\FactoryTalk2Nimbus

Copy the files FactoryTalk2Nimbus.exe and FactoryTalk2Nimbus.ini to the newly created folder

Set the Folder Access Rights as above (Users -> Full control).

You will now be able to edit the configuration file without the need to store it somewhere else or run *Notepad* as administrator. Now edit the configuration file using *Notepad*.

Edit the *SQLConnectionString* paramter as appropriate. If database name etc is the same as in the example you will only need to change the UID and PWD properties.

The default database scan rate is 5 seconds (5000 msecs).

When *FactoryTalk2Nimbus* is started, its first SQL select command will use the current time subtracted by the number of minutes in the *PreStartPollTime* parameter. The default setting is *PreStartPollTime=5*. This will cause *FactoryTalk2Nimbus* to retrieve all alarms in the SQL database that is no more than 5 minutes old. The next alarm poll will use the most recent found alarm timestamp to find newly occurred alarms and so on.

This ensures no alarms are lost during server startup.

However if *FactoryTalk* inserts a lot of new alarm events into the SQL database during server startup this time need to be adjusted. It is also possible to enter a negative number, ex -2 will cause *FactoryTalk2Nimbus* to retrieve alarms occurring 2 minutes or later from when it was started.

### Install FactoryTalk2Nimbus and Nimbus Server at different servers

The default Nimbus export method (transferring alarm events to Nimbus) is *ExportMethod=3*. This means the *FactoryTalk2Nimbus* will place the new alarms directly into the Nimbus 3 server alarm queue using a DLL. This makes the Nimbus setup very easy, since no *SCADA Import* setup is needed.

If Nimbus server and *FactoryTalk2Nimbus* is installed on different servers, *ExportMethod=0* should be used. The *SCADA Import Generic TCP (client)* need to be added and configured in *Nimbus Explorer*.

If *ExportMethod=0* then *FactoryTalk2Nimbus* will act as a TCP socket server on port 14000 and *Nimbus Alarm* Server will connect as client to this port.

The port number may be changed in the configuration file and in Nimbus Explorer SCADA Import setup.

You will need to setup firewall rules as appropriate.

### Starting FactoryTalk2Nimbus

#### First of all start Nimbus Alarm Server

Start *FactoryTalk2Nimbus* as *Administrator*. It should generally be run as a service, but before configuring it as a service we recommend you test it as it will provide some information in the *FactoryTalk2Nimbus* window. This information is also stored in the text based logfiles created in the *LogFiles* subfolder. The subfolder will be created automatically.

Change some alarm in *FactoryTalk*. It should appear just as the *SOP400\_PS07\_Alm\_TgtDisagree* alarm above.

The alarm should also appear in *Nimbus Explorer* as above. Double click the alarm in *Nimbus Explorer* to view all properties.

# Configuring FactoryTalk2Nimbus to run as a Service

Stop the application by pressing *Enter* in the *FactoryTalk2Nimbus* window.

Open a CMD-window as Administrator and step down to the FactoryTalk2Nimbus folder.

Administrator: C:\Windows\system32\cmd.exe	
C:\Program Files (×86)\TroSoft\FactoryTalk2Nimbus>factorytalk2nimbus . FactoryTalk2Nimbus installerades som tjänst	/i 🔒
C:\Program Files (x86)\TroSoft\FactoryTalk2Nimbus>

	Extended Standard					

Open Service Control Manager and start the FactoryTalk2Nimbus service.

It will automatically start when the server is restarted but needs to be started manually the first time.

To remove it from services, use the switch /u

If you configured SQL to use only *Windows Authentication* instead of *UID / PWD* you might need to change user in the *Logon As* tab in the services' properties. The service will by default run as *Local System Account*.
